VENTI DART™ TRANSPARENT IoT ANTENNA

THE IMPORTANCE OF A SUPERIOR IoT ANTENNA

Traditional IoT Antennas are either embedded within devices or mounted externally.

Embedded antennas suffer performance limitations due to size constraints and proximity to other electrical components that can interfere with RF signals.

Externally mounted antennas, while better performing are generally unattractive and more easily subject to breakage, vandalism and premature wear due to the elements.

In both cases, the security of your IoT network is put at risk. VENTI's DART Transparent WiFi Antenna solves these problems.

DART's small form factor combined with its unique performance characteristics makes it the ideal solution where a device requires an embedded antenna. And DART's transparent, rugged, flexible design is ideal for externally mounted antennas, reducing the risk of damage while being unobtrusive to passersby.
